1. INTRODUCTION

1.1 Project Overview :

Customer support teams receive a large number of tickets daily, while prioritization and assignment can be manual. This project provides a Salesforce-based solution that analyzes ticket information, classifies urgency, assigns the appropriate support level, and initiates automation for critical cases.

1.2 Purpose :

- Automatically classify support tickets as High, Medium, or Low priority.
- Retrieve the latest support ticket associated with a customer Account.
- Reduce manual prioritization and assignment effort.
- Create an urgent handling task for High-priority tickets.
- Use Agentforce to analyze ticket details and trigger backend automation.
- Improve ticket response and resolution efficiency.

2. IDEATION PHASE

2.1 Problem Statement

Manual ticket prioritization and assignment can cause delays, missed urgent issues, and increased workload for support agents.

2.2 Empathy Map Canvas

The empathy map identifies the needs, challenges, feelings, and expectations of support agents and customers while handling support tickets.

2.3 Brainstorming

Different ideas were explored to automate ticket analysis, priority classification, task creation, agent assignment, and SLA monitoring.

3. REQUIREMENT ANALYSIS

3.1 Customer Journey Map

The journey map shows how a support ticket moves from creation and analysis to priority assignment, agent handling, and resolution.

3.2 Solution Requirements

Defines the functional and non-functional requirements needed to develop the Salesforce support-ticket automation system.

3.3 Data Flow Diagram

Shows how ticket, Account, Contact, User, and Task data flows through Salesforce Flow and Agentforce.

3.4 Technology Stack

The solution uses Salesforce, Auto-Launched Flow, Agentforce, custom objects, and standard Salesforce records.

4. PROJECT DESIGN

4.1 Problem–Solution Fit

The proposed solution addresses manual prioritization, task creation, assignment, SLA monitoring, and ticket-analysis challenges through automation.

4.2 Proposed Solution

Agentforce analyzes the ticket description, while Salesforce Flow determines priority, creates Tasks, assigns agents, and checks SLA risk.

4.3 Solution Architecture

The architecture connects the user, Agentforce, Salesforce data, Flow automation, task assignment, and final conversational response.

5. PROJECT PLANNING & SCHEDULING

5.1 Project Planning

The project follows Agile methodology using product backlogs, user stories, story points, and sprint-based development.

6. FUNCTIONAL & PERFORMANCE TESTING

6.1 Performance Testing

The system is tested for ticket analysis, priority classification, task creation, assignment, SLA checking, and Agentforce response performance.

7. RESULTS

8. ADVANTAGES & DISADVANTAGES

Advantages:

Reduces manual effort, improves priority keyword-based priority rules may require updates, and Salesforce/Agentforce access handling, supports faster response, and provides consistent automation.

Disadvantages:

Depends on correct configuration, keyword-based priority rules may require updates, and Salesforce/Agentforce access is required.

9. CONCLUSION

The system successfully automates support-ticket analysis, priority prediction, task creation, assignment, and SLA monitoring using Salesforce and Agentforce.

10. FUTURE SCOPE

Future improvements can include advanced AI-based priority prediction, real-time notifications, dashboards, sentiment analysis, multilingual support, and integration with external support systems.
