

**Project Design Phase
Problem – Solution Fit Template**

Date	03 October 2026
Team ID	SWTID-2026-6200
Project Name	The Customer Support Ticket Priority Prediction and Automated Assignment System using Agentforce
Maximum Marks	2 Marks

1. Problem Identification (Customer Pain Points)

Support tickets are manually prioritized, causing delays in identifying urgent issues.

High-priority or critical tickets may be missed during manual review.

Support agents spend time creating follow-up tasks manually.

Manual ticket assignment can result in inconsistent handling.

SLA risks may be overlooked by support agents.

Long ticket descriptions take time to analyze.

Support agents need an easy way to access ticket information and analysis.

2. Target Customer / User

Support agents who handle customer support tickets.

Support managers or administrators who monitor ticket priority, assignment, and SLA.

Customers whose support issues are managed through Salesforce.

3. Behavioral Patterns

Support agents regularly check new and pending tickets.

Agents manually review ticket descriptions to understand urgency.

High-priority tickets require faster follow-up.

Agents need quick access to ticket status, priority, and SLA information.

Users prefer simple conversational interaction for retrieving ticket information.

4. Solution Description (Fit to Problem)

Automated Salesforce Flow analyzes ticket information and determines priority.

High/Critical tickets automatically generate follow-up Tasks.

Flow assigns tickets to the appropriate support agent or queue.

SLA risk is automatically checked for open tickets.

Agentforce analyzes ticket descriptions and provides conversational insights.

Support agents can ask Agentforce questions and receive ticket summaries, priority details, and recommended actions.

5. How the Solution Solves the Problem

Manual ticket prioritization → Salesforce Flow automatically analyzes ticket details and assigns the appropriate priority.

Urgent tickets may be missed → High/Critical conditions identify important tickets and ensure they receive immediate attention.

Manual task creation → Flow automatically creates a Task for High/Critical priority tickets.

Manual support assignment → Flow automatically assigns the ticket to the appropriate support agent or queue.

SLA risk may be overlooked → Flow checks SLA conditions and identifies tickets that are at risk of breach.

Time-consuming ticket analysis → Agentforce analyzes the ticket description and provides a quick summary.

Difficulty accessing ticket information → Agents can ask Agentforce questions using natural language and get relevant ticket details.

Inconsistent ticket handling → Configured Flow rules ensure tickets are processed consistently.

Manual follow-up → Automated Tasks and notifications help agents follow up on important tickets.

Lack of quick decision-making → Agentforce provides priority, SLA status, and recommended next actions in a conversational response.

6. Key Purpose Achieved

Reduces manual effort in support-ticket processing.

Helps identify and handle high-priority tickets faster.

Improves consistency in ticket assignment and follow-up.

Provides better awareness of SLA risks.

Helps support agents understand tickets quickly using Agentforce.

Provides a simple conversational interface for ticket analysis.
