

Solution Architecture

Date	03 October 2026
Team ID	SWTID-2026-6200
Project Name	The Customer Support Ticket Priority Prediction and Automated Assignment System using Agentforce
Maximum Marks	4 Marks

Solution Architecture Overview

The Support Ticket Intelligence and Agentforce Analysis solution is designed to automate support-ticket processing, improve ticket prioritization, reduce manual effort, and provide quick conversational access to ticket information. The solution uses Salesforce as the primary platform, with Auto-Launched Flow for workflow automation and Agentforce for AI-based ticket analysis.

Goals of the Solution Architecture

- Identify an effective technology solution for support-ticket management.

- Automate ticket priority classification and support-agent assignment.

- Reduce manual effort in Task creation and ticket processing.

- Provide SLA risk awareness for support agents.

- Enable conversational ticket analysis using Agentforce.

- Provide a scalable and secure Salesforce-based architecture.

Architecture Components & Data Flow

User Layer

- Support agents interact with the system through the Salesforce interface.

- Users can create, view, and manage support tickets.

- Agents can use Agentforce to ask questions about tickets and receive analysis.

Application / Workflow Layer

- Salesforce manages Cases, Accounts, Contacts, Users, and Tasks.

- Auto-Launched Flow processes ticket information automatically.

- Flow Decision evaluates ticket priority and configured conditions.

- Flow assigns tickets to the appropriate support agent or queue.

- Flow creates Tasks for High/Critical priority tickets.

AI Layer

Agentforce analyzes the ticket subject and description.

Support Ticket Priority Analysis Subagent identifies urgency, impact, and suggested priority.

Agentforce provides ticket summaries and recommended next actions.

Database Layer

Support_Ticket_Intelligence__c stores ticket intelligence information.

Salesforce records store Account, Contact, User, Case, and Task information.

Salesforce provides secure and scalable cloud-based data storage.

SLA & Monitoring Layer

Flow checks SLA-related conditions for open tickets.

Tickets approaching SLA deadlines can be marked as At Risk.

SLA-breach risks can be communicated to the assigned support agent.

Security Layer

Salesforce authentication and authorization control system access.

Profiles and Permission Sets control user permissions.

Sharing Rules control record-level access.

Field-Level Security protects sensitive customer and ticket information.

Data Flow Description

Step-by-Step Flow

Support agent accesses Salesforce and creates or opens a support ticket.

Account and Contact information is associated with the ticket.

Agentforce analyzes the ticket description using the Support Ticket Priority Analysis Subagent.

Auto-Launched Flow receives the ticket information and starts processing.

Flow Decision determines the appropriate ticket priority.

If the ticket is High/Critical, Flow automatically creates a Task.

Flow assigns the ticket to the appropriate support agent or queue.

SLA Risk Check evaluates whether the ticket is approaching its SLA deadline.

The processed information is stored in Salesforce records.

Agentforce provides the final conversational response with ticket summary, priority, SLA status, and recommended action.
