

Project Design Phase-II Technology Stack (Architecture & Stack)

Date	03 October 2026
Team ID	SWTID-2026-6200
Project Name	The Customer Support Ticket Priority Prediction and Automated Assignment System using Agentforce
Maximum Marks	4 Marks

Technical Architecture

The Support Ticket Intelligence and Agentforce Analysis solution is designed as a cloud-based customer support management application using Salesforce as the primary platform. The architecture integrates Salesforce Case and customer data with automated Flow-based processing and Agentforce-powered conversational analysis.

The solution enables support agents to create and manage support tickets, associate Accounts and Contacts, analyze ticket descriptions, automatically classify ticket priority, create tasks for high-priority cases, assign tickets to support agents, and monitor SLA breach risks.

Key Features of the Architecture

User Layer:

Support agents interact with the system through the Salesforce user interface and Agentforce conversational interface.

Application Layer:

Salesforce manages Cases, Accounts, Contacts, Users, Tasks, business logic, assignment, and automation.

Automation Layer:

Auto-Launched Flow performs ticket processing, priority evaluation, assignment, SLA checking, and record creation.

AI Layer:

Agentforce and the Support Ticket Priority Analysis Subagent analyze ticket descriptions and provide conversational insights.

Database Layer:

Salesforce stores support-ticket intelligence and related Account, Contact, User, Case, and Task information.

Output Layer:

Agentforce provides conversational responses containing ticket summaries, priority classification, SLA status, and recommended actions.

Table-1: Components & Technologies

S.No	Component	Description	Technology / Tool Used
1	User Interface	Interface through which support agents create, view, and manage support tickets	Salesforce Lightning Experience
2	Ticket Management	Creation and management of customer support tickets	Salesforce Case
3	Customer Data	Stores and manages customer Account and Contact information associated with tickets	Salesforce Account, Contact
4	Application Logic	Processes ticket information and executes business rules	Salesforce Auto-Launched Flow
5	Priority Classification	Determines ticket priority based on configured conditions and analysis	Salesforce Flow Decision + Agentforce
6	AI Analysis	Analyzes ticket description, urgency, impact, and priority	Agentforce
7	Database	Stores ticket intelligence and related records	Support_Ticket_Intelligence__c, Case, Account, Contact, User, Task
8	Notifications	Notifies support agents about assignments, high-priority tickets, and SLA risks	Salesforce Flow / Notifications
9	Cloud Infrastructure	Hosts the application, data, automation, and AI services	Salesforce Cloud

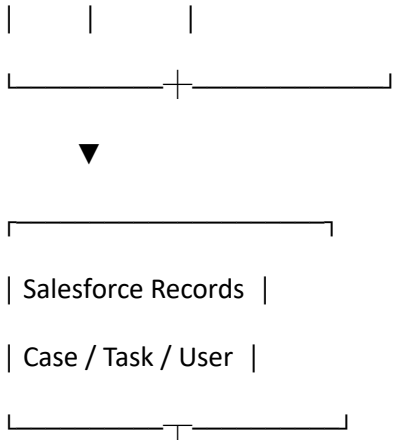

10	Conversational Output	Provides ticket analysis and recommendations through natural-language interaction	Agentforce
11	SLA Monitoring	Checks whether a ticket is approaching or exceeding its SLA	Salesforce Flow + SLA fields
